Slide 1: Problem Statement & Context

What problem are you solving, and for whom?

What to include:
Clearly define the problem your prototype addresses. Specify the target users, the real-world context, and why this problem matters. Avoid generic statements. Be specific about the pain point, the current gap, and the impact if the problem remains unsolved.

In 5 to 6 crisp bullet points, explain:

- Who the user is
- What challenge they face
- Why existing solutions are insufficient
- Why this problem is worth solving now

Judges should immediately understand the relevance and urgency of your idea.

Slide 2: Solution Overview

What have you built?

What to include:
Provide a high-level explanation of your prototype. This is not a deep technical dive. Instead, explain your core concept in simple, structured language.

Describe:
- What your product does
- The primary value it delivers
- The main workflow from start to finish
- What makes your approach distinct

Think of this as the "executive summary" of your working prototype.

Slide 3: Key Features & User Flow

How does it work end to end?

What to include:
List your most important features. Focus on functionality that is actually implemented in your prototype, not future ideas.

Explain:
- The top 3 to 5 features
- How users interact with your system
- The step-by-step flow from user input to final output
- If helpful, include a simple flow diagram or annotated screenshots.

Judges should be able to understand the complete journey without watching the video.

Slide 4: Architecture & Technology Approach

How is your prototype built?

What to include:
Explain your technical structure at a conceptual level. Do not overload with code. Instead, show how the pieces connect.

Include:
- System architecture diagram (simple and clear)
- Key components and how they interact
- AI services, APIs, or tools used
- Data flow (input → processing → output)

The goal is to demonstrate technical clarity, logical design, and thoughtful implementation decisions.

Slide 5: Design Decisions & Trade-offs

Why did you build it this way?

What to include:
This is where you demonstrate maturity. Explain the decisions you made during development and why.

Discuss:
- Features you prioritized
- Features you intentionally dropped
- Technical constraints you faced
- Timeline-driven compromises
- Usability considerations

Judges appreciate teams that understand realism, constraints, and trade-offs.

Slide 6: Current Status, Limitations & Next Steps

Where you are now, and what comes next

What to include:
Be honest and clear about what works and what is still evolving.

Include:
- What is fully functional
- What is partially implemented
- Known limitations
- Planned improvements
- What you would refine with mentorship

This slide signals that you understand the difference between an initial prototype and a scalable product.

Keep your deck concise, visual, and structured. Avoid dense text. Judges should be able to understand your prototype in under 5 minutes just by reviewing these slides.

Clarity beats complexity. Precision beats volume.
